Baano Healthcare App

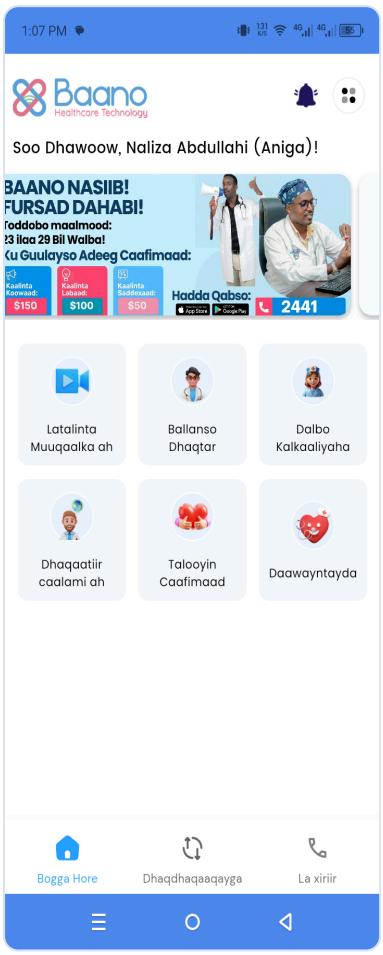

Case Study 1, Phases 2 to 4: Color and Typography, UI Fundamentals and Visual Hierarchy, Icons, Layout and Imagery

Phase 2

Evaluating Color Theory

Does the palette fit the brand, read well and give enough contrast?

Header blue	Buttons	Accent pink	Card tint	Search bar
#4E88EE	#28A4FF	#E5648A	#EEF4FF	#000000

Brand identity and purpose

A blue and white base with the pink from the Baano logo feels clean and medical, which suits a trusted health service. Pink is used well for secondary actions (Iska Xir, Bilaash Ah), but the promo banner adds many extra colors that dilute the identity.

Readability, emphasis and engagement

Bright blue full-width buttons such as Qabso Ballan and Furo stand out clearly. Yellow rating stars and the busy banner compete for attention on the home screen.

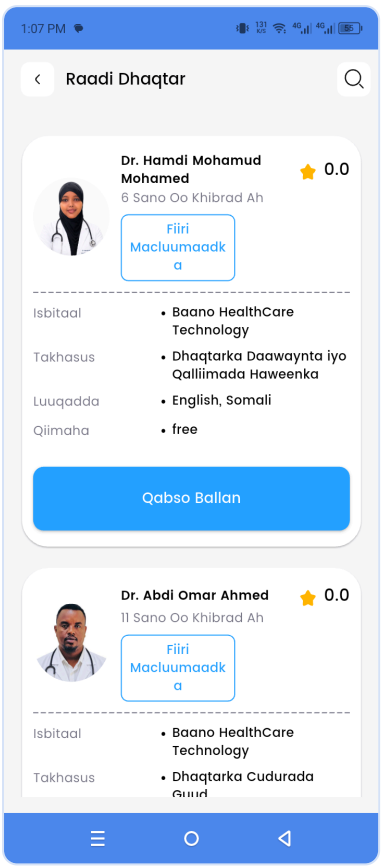

Contrast between text and background

Calculated ratios: white on the #4E88EE header is about 3.4:1 and white on #28A4FF buttons about 2.7:1, below the 4.5:1 WCAG AA target. The grey placeholder on the black search bar is hard to read.

Phase 2

Evaluating Typography

Hierarchy, size and weight, and consistency across screens

Distinction between headings, subheadings and body

Screen titles in the top bar, bold doctor names and lighter detail text give a basic three-level structure. Subheadings are weak: labels such as Isbitaal and Takhasus look almost the same as their values.

Font sizes, styles and weights

Names and button labels are readable, but Fiiri Macluumaadka breaks mid-word, titles are truncated (Dooro Takhasusya...) and the bottom-navigation labels are very small. The heading on the international doctors screen is far larger and heavier than anything else.

Consistency across screens

One clean sans-serif and repeating rounded cards feel consistent. Inconsistency shows in heading size from screen to screen and in mixed Somali and English text (free, Patient, Referral Code).

Phase 2

Recommendations: Color and Typography

1. Deepen the blues

Use a darker blue such as #1A6FBF (about 5:1 with white) for header and buttons. White text becomes readable for everyone, including older users.

2. Replace the black search bar

Use a light field with a thin border and a darker placeholder. The search looks friendlier and fits the soft palette.

3. Keep banners on brand

Limit promo banners to blue, white and pink. The home screen feels calmer and the brand is recognised faster.

4. Define a type scale

Example: title 20 bold, section 16 semibold, body 14 regular, caption 12 minimum. Users can scan screens faster.

5. Fix wrapping and truncation

Shorten labels, wrap whole words, allow two-line titles. No more broken words or cut-off tab names.

6. Add accessibility options

Offer font size, high contrast and dark mode in settings. More people can use the app comfortably.

Phase 2

Summary and Reflection

Findings

- The blue, white and pink palette matches the brand and feels medical and trustworthy.
- Primary buttons stand out, but contrast on the header, buttons and search bar is too low.
- Typography is a clean sans-serif, yet labels and values look alike and some text breaks or is cut off.
- Mixed languages and an oversized heading weaken consistency.

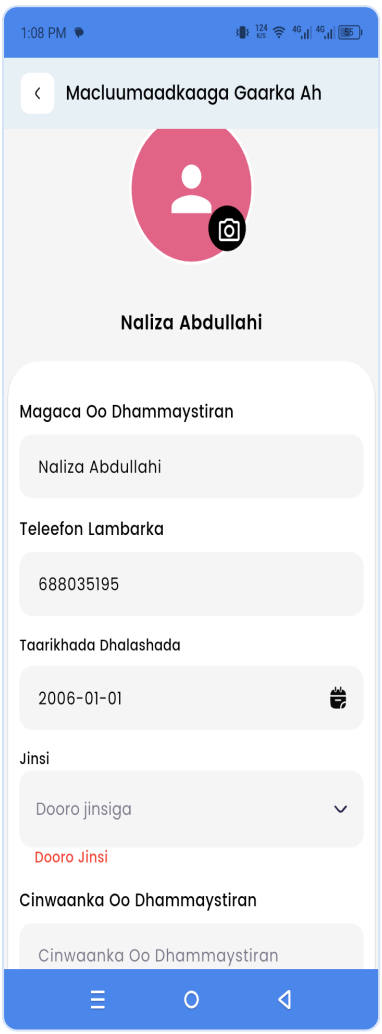

Reflection

Color and type are the first things a patient notices. A health app must feel calm, trustworthy and easy to read, especially for first-time and older users. Better contrast, a clear type scale and one language per screen would reduce mistakes and increase confidence, so more people finish booking.

Phase 3

Fundamentals of UI Design

Components, interactive elements, states and feedback

Visual components

Buttons are clear: full-width blue primary, outlined secondary and pink Iska Xir. The 3-tab bottom bar and home grid are simple. The middle tab icon (arrows) does not clearly say what it opens.

Interactive elements

Profile fields are large, rounded and labeled; the date field has a calendar icon and gender is a dropdown. The country picker with Bilow is easy to tap. No sliders or checkboxes were seen.

Interaction states

Static screenshots show mostly default states. We could not confirm pressed, focus or disabled styles; as noted in Case 1, an inactive Sii Wad button is not clearly different. Hover does not apply on touch screens.

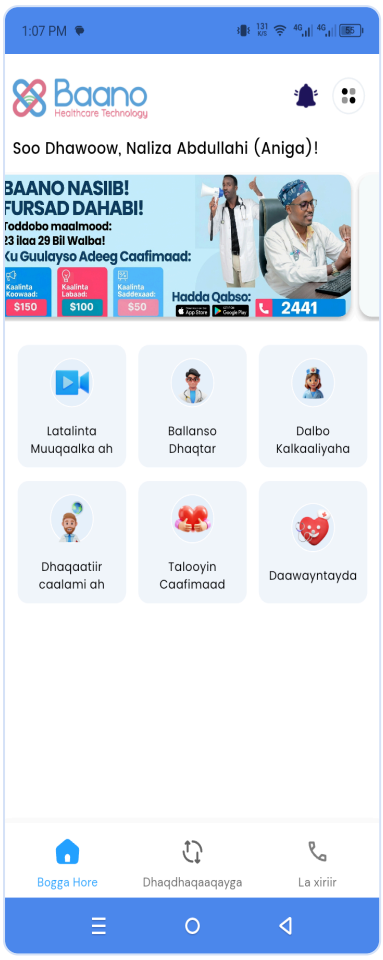

Feedback and responsiveness

Inline red error (Dooro Jinsi) under Gender is good real-time feedback. But there are no tooltips or help text, the 0.0 rating is unexplained and errors rely on small red text.

Phase 3

Principles of Visual Hierarchy

Size, spacing, weight, alignment and proximity

Size and scale

Greeting, doctor names and primary buttons are easy to spot. But the promo banner is the largest element on home and pulls attention from the six small feature tiles.

Spacing and white space

Cards and tiles have even padding and rounded corners. Home has a large empty area below the grid, while the banner and doctor cards are dense with text.

Typography and font weight

Bold works well for doctor and hospital names. Secondary details (Isbitaal, Takhasus, Luuqadda, Qiimaha) have little weight difference from values, so scanning is slower.

Alignment and proximity

The grid is aligned and contact rows are grouped with chevrons. In doctor cards the actions are split: Fiiri Macluumaadka sits under the name, Qabso Ballan below the details.

Phase 3

Recommendations: UI Fundamentals and Hierarchy

1. Rebalance the home screen

Shrink the banner into a slim carousel, enlarge tiles and labels, and fill the empty space with the next appointment and quick search.

2. Define button states

Design default, pressed, focused and disabled looks (grey when disabled). Users know when a tap worked or is not yet available.

3. Give richer feedback

Add success messages (booking confirmed), tooltips for fee and rating, and errors with icon, text and a fix hint.

4. Strengthen label and value

Small grey labels with medium dark values, and semibold section headings. Doctor details become quicker to scan.

5. Group related actions

Put Fiiri Macluumaadka and Qabso Ballan side by side at the card bottom, primary on the right. The next step is obvious.

6. Use a spacing system

Apply an 8-point grid (8, 16, 24) for margins and padding. Screens look orderly and less cluttered.

Phase 3

Summary and Reflection

Findings

- Buttons, cards and forms are clear and consistent, with helpful inline validation.
- Interaction states and tooltips are not visible, so users get little feedback.
- The promo banner outweighs core features and the home screen has unused space.
- Label and value text have similar weight, and related actions are separated.

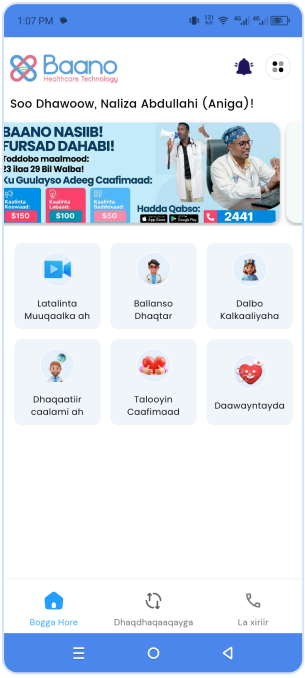

Reflection

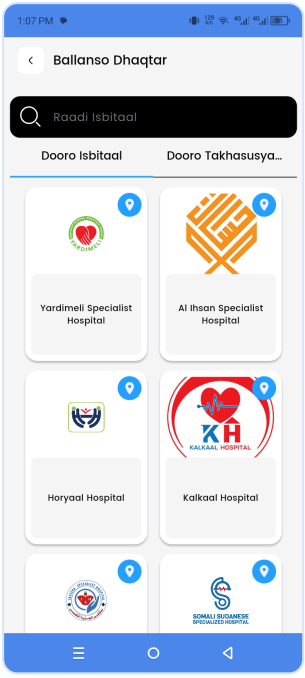

Strong UI fundamentals tell users what is tappable and what just happened. A clear hierarchy guides the eye to the main action first. For Baano, balancing the home screen and adding feedback would shorten the path to booking a doctor and reduce hesitation, which raises engagement.

Phase 4

Icons

Navigation and core actions, consistency of style, size and meaning

Navigation and core actions

Home tiles use recognisable 3D-style icons (video, doctor, nurse, heart). Bottom navigation uses home, arrows and phone. Search and map pins on hospital cards are clear. The arrows icon on the Dhaqdhaqaaqayaga tab is ambiguous.

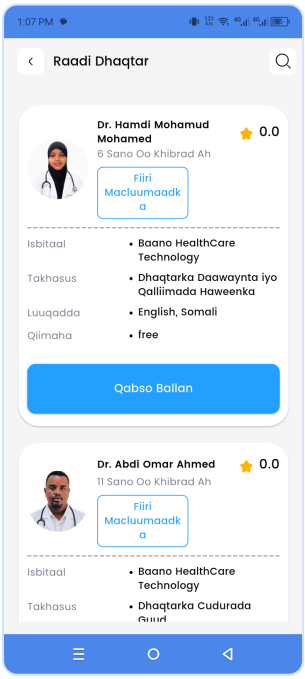

Consistency of size, style and meaning

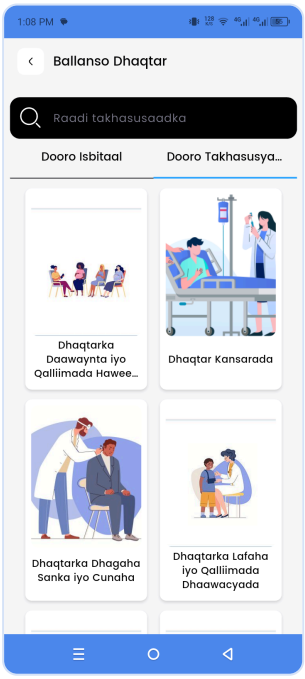

Styles are mixed: 3D icons on home, flat illustrations for specialties, filled blue icons in contact rows and a pink camera badge on the profile. Sizes vary between screens. Meaning is mostly consistent (search, chevrons, pins).

Phase 4

Layout

Logical structure and clarity of content arrangement

Clean and logical layout

Home follows a clear order: greeting, promo, 3x2 grid, bottom bar. Booking moves from hospital or specialty tab to doctor list to details. A consistent top bar with back arrow and title, and a tidy 2-column card grid for hospitals.

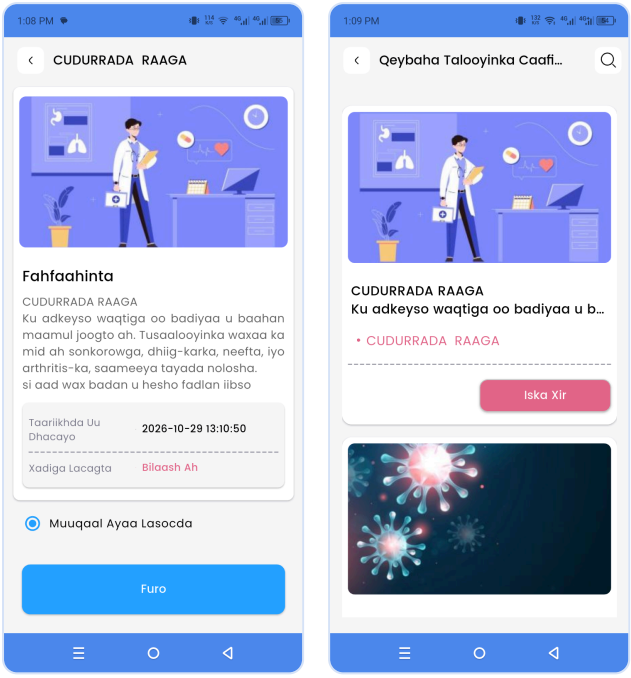

Content arrangement and ease of use

Doctor cards stack many details above one big button, which is clear but long. Truncated titles and the heavy black search bar reduce clarity, and the empty home area wastes prime space.

Phase 4

Imagery

Support for the brand and quality across sections

Brand and engagement

Hospital logos build local trust, and illustrations on specialties and tips make medical topics friendly. Real doctor photos in the banner feel human, and the Baano logo appears on home and contact.

Quality and relevance

Quality varies: hospital logos have different sizes and backgrounds, illustration styles differ, the banner is crowded with small text, some tip images are generic and doctor photos are small avatars.

Phase 4

Recommendations: Icons, Layout and Imagery

1. Unify the icon set

One outlined, rounded style at a fixed size (24 px, 2 px stroke) for navigation and actions. The interface looks consistent and professional.

2. Clarify ambiguous icons

Use a calendar icon for appointments and keep text labels under each icon. Users know where bookings live.

3. Reorganise the home layout

Slim banner, quick search, upcoming appointment, then the feature grid. Key actions are reachable in one tap.

4. Simplify doctor cards

Show name, specialty, fee, rating and one primary button; move extra details to the profile page. Lists become easier to scan.

5. Standardise imagery

Place hospital logos in equal square containers and use one illustration style with sharp assets. Sections feel like one brand.

6. Improve photos and banners

Use consistent doctor photo crops with a default avatar and keep banner text short. People trust real, clear faces.

Phase 4

Summary and Reflection

Findings

- Icons are mostly recognisable, but their styles and sizes are mixed and one nav icon is unclear.
- The layout is logical and card-based, though dense cards, truncated titles and empty home space hurt clarity.
- Imagery supports trust through hospital logos, illustrations and doctor photos, but quality is uneven.

Reflection

Icons, layout and imagery act as the app's guide: they show where to go, in what order and who to trust. A single icon style, a tidier home layout and consistent images would make Baano feel more reliable and help first-time users move from search to booking with less effort.

Thank you. Questions?
